/note="Vector: pBluescript II SK-; Site_I: ECORI; Site_2:
Xhoi; This library, constructed by John Davies and Jeffrey
McDermott, combines cDNAs from CC-1690 cells grown to
mid-log phase in TAP (actate-containing) medium in the
light, TAP medium in the dark, HS (minimal) medium in the
light, TAP medium in the dark, HS (minimal) medium in
ambient levels of CO2 and HS medium bubbled with 5% CO2.
PolyA mRNA was purified from each sample, pooled and cDNA
synthesized. The cDNA was directionally cloned into lambda
ZAP II (Stratagene) in the EcoRI (5') and XhoI (3') sites,
pBluescript II SK- plasmids were excised from the lambda
ZAP clones by superinfection with Exassist (Stratagene)
phage. The library was normalized using method 4 described
in Bonaldo et al (1996) Genome Research 6: 791-806."

Vector DNA was prepared from a derivative of pMD42 (911473211419b1AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll X110-Gold (Stratagene) cells and selected for amplcillin resistance."

The DNA was hydrodynamically sheared by repeated passage through 60.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryota; Metazoa; Chordata; Cranlata; Vertebrata; Euteleostom!;

Library is oligo-dT primed and directionally cloned (Ecovo site is destroyed upon cloning). Acrage insert size 1.7 kb, insert size range 1.2-3.3 kb. Library is normalized and enriched for full-length clones and was constructed by C. Gruber (Invitrogen). Research Genetics tracking code 027. Note: this is a NIH, MGC Library."

JOURNAL Submission Submitted (12-JUL-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 18A, UK. E-mail enquiries: humquery@sanger.ac.uk CB10 18A, UK. E-mail enquiries: humquery@sanger.ac.uk COMMENT on Jul 84, 2001 this sequence version replaced gi:14575291. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality) as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL: Sw:, SWISSPROT; Tr:, TREMBL: Wer, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 10, constructed by the Sanger Centre Chromosome 10	Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr10 RP11-34333 is from the library RPCI-11.2 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm VECTOR: pBAces.6 http://www.chori.org/bacpac/home.htm VECTOR: pBAces.6 This sequence is the entire insert of clone RP11-343J3 The true left end of clone RP11-242G20 is at 139955 in this sequence. The true right end of clone RP11-404C6 is at 6588 in this sequence. It currently consists of 24 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Center code: WIBS

McCombie,W.**, Baker,'D.**, Balija,V., Dedhia,N.N., de la Mastide,M., Katzenberger,F., Kult,K., King,L., Kirchoff,K.A., Miller,B., Muller,S., Nascimento,L.U., O'Shaughnessy,A.L., Preston,R.K., Santos,L., Spiegel,L.A., Palmer,L., Yang,C. and
                                                                                                                                                                                                                                                                                                                                                                                                                                                            arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                     NOTE: This is a 'working draft' sequence. It currently consists of 17 contigs. The true order of the pleces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                            Insert size: 173000; agarose-fp

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NOTE: This is a 'working draft' sequence. It currently consists of 36 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                           Sequencing vector: plasmid: 100%
Sequencing vector: plasmid: 100%
Chemistry: Dye-primer ET; 0% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.990319
Consensus quality: 173518 bases at least 030
Consensus quality: 177276 bases at least 030
Consensus quality: 17761b bases at least 030
Insert size: 192000; agarose-fp
Insert size: 184535; sum-of-contigs
Quality coverage: 3.66 in 020 bases; agarose-fp

NOTE: This is a 'working draft' sequence. It currently
consists of 55 contigs. The true order of the places
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence
as soon as it is available and the accession number will
be preserved.
NOTE: Estimated insert size may differ from sequence length

The protein is used to control and participate in gene expression, by acting as transcriptional activator, strictly dependent on the presence of an intact E box (CANNTG), particularly for targeting expression of proteins to the central nervous system (CNS). The nucleic acid sequence can be used to treat nervous system disorders, and antisense sequences can be used to control mRNA transcription.
                                                                                                                                                                                                                                                                                  SerProGlyGlyProProGlyAspTrpGlySerLeuTyrSerProValSerGlnAlaGly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The human neurogenin 3 Ngn3 DNA sequence AAC61089 encodes the Ngn3
CC protein AAY85617. The Ngn3 gene is located at chromosome position
CC 10q22.1-22.2. The invention relates to the human Ngn3 nucleotide and
CC protein sequences, and includes an antibody recognising the Ngn3 protein.
Also included in the invention is a method for identifying an islet cell
CC precursor, the method involves analysing a cell for the expression of the
Ngn3 gene product, where detection of the product is indicative of an
CC reagent for detecting (in a subject) a predisposition to a defect in
CC pancreatic islet cell function or formation associated with a defect in
CC Ngn3 activity. The Ngn3 protein is useful for identifying beta-cell
C precursor cells expressing Ngn3, and to alter cellular differentiation in
CC mellitus.

The Mouse neurogenin 3 is one of several neurogenin proteins discussed in the present invention. The neurogenin nucleic acids can be expressed in a host cell, transformed using an expression vector, to produce recombinant proteins. The proteins and the antibodies raised against the proteins are useful in the study of neurogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   279

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The patent discloses a method for inducing non-neuronal cells (NNC) to differentiate into neurons and for NNCs to express a neuronal subtype—specific marker. Transformed host cells are used as sources of neuronal and other growth factors; in culture for screening compounds that modulate neural differentiation or as sources of recombinantly produced neurogenins and Phox2a proteins for use in transplantation. The cells also have a variety of in vivo uses, e.g. for transplantation at sites of optical or auditory nerve damage, brain or spinal cord injuries, and neurodegenerative disorders e.g. Alzheimer's disease. The present sequence encodes murine neurogenin-3 (NGN-3), a transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Phox2a protein; neuronal subtype-specific marker; growth factor; neurolal differentiation; transplantation; neuronal dysfunction; optical nerve damage, neurodegenerative disorder; neuroprotective; nootropic; anticonvulsant; antiparkinsonian; vulnerary; cerebroprotective; immunesuppressant; antilnfectious; ds.

amino acid sequence, or any of its homologues or orthologues as the reapeutic agents for the treatment of deafness, partial hearing loss, vestibular effects due to damage or loss of inner hair cells, osteoarthritis and abnormal cell proliferation. The invention also encompasses methods of screening for compounds which affect the expression of an atonal associated nucleic acid sequence, in an animal, and a transgenic animal in which an allele of a native atonal associated in activating the atonal associated allele. The nucleic acids or proteins may be used in a method of treating an animal for hearing impairment, joint disease, balance disorders, abnormal cell proliferation, or other disease, to loss of a functional atonal associated nucleic acid or protein. They may particularly be used to treat an animal with a deficiency in cerebellar granule neurons or their precursors, and may and may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    also be used in promoting mechanoreceptive cell growth and generating hair cells. The present sequence represents an atomal-associated nucleic acid sequence referred to in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Therapeutic use of atonal-associated nucleic acids or amino acids, or any of its homologs or orthologs, for the treatment of e.g. deafness, osteoarthritis and abnormal cell proliferation -

The human neurogenin 3 Ngn3 DNA sequence AAC61089 encodes the Ngn3 protein AAY85617. The Ngn3 gene is located at chromosome position 10422.1-22.2. The invention relates to the human Ngn3 nucleotide and protein sequences, and includes an antibody recognising the Ngn3 protein. Also included in the invention is a method for identifying an islet cell precursor, the method involves analysing a cell for the expression of the Ngn3 gene product, where detection of the product is indicative of an islet cell precursor. The Ngn3 squence is useful as a diagnostic reagent for detecting (in a subject) a predisposition to a defect in pancreatic islet cell function or formation associated with a defect in
                                                                                                                                                                                                                                                                                                                                      Ngn3 activity. The Ngn3 protein is useful for identifying beta-cell precursor cells expressing.Ngn3, and to alter cellular differentiation in culture in vivo to produce new beta-cells to treat patients with diabetes mellitus. The present sequence represents the murine Ngn3 genomic DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sedneuce

Therapeutic use of atonal-associated nucleic acids or amino acids, or any of its homologs or orthologs, for the treatment of e.g. deafness, osteoarthritis and abnormal cell proliferation -

Disclosure; Page -; 142pp; English.

amino acid sequence, or any of its homologues or orthologues as therapeutic agents for the treatment of deafness, partial hearing loss, vestibular effects due to damage or loss of inner hair cells, osteoarthritis and abnormal cell proliferation. The invention also encompasses methods of screening for compounds which affect the expression of an atonal-associated nucleic acid sequence in an animal, and a transgenic animal in which an allele of a native atonal-associated gene is replaced by a heterologues nucleic acid sequence, thus inactivating the atonal-associated allele. The nucleic acids or proteins may be used in a method of treating an aminal ich hearing impairment, joint disease, balance disorders, abnormal cell proliferation, or other disease related to loss of a functional atonal-associated or nucleic The invention relates to the use of atonal-associated nucleic acid or precursors, and may also be used in promoting mechanoreceptive cell growth and generating hair cells. The present sequence represents an atonal associated nucle acid sequence referred to in the invention.

Note: The present sequence is not shown in the specification, but protein. They may particularly be used to treat an animal with a deficiency in cerebellar granule neurons or their precursors, am

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-cpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated to two classes, each with at least one member, of oligonucleotides and/or peptide nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the mapplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue methylation status of many C residues to be determined almultaneously. Asgal3410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic CDNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the member, of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the rentral nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (11) for differentiation of cell or tissue polymorphisms (SNP's); and (11) for differentiation of cell or tissue methylation status of many C residues to be determined simultaneously. ABQ13110-ABQ54121 represent genomic DNA sequences used to illustrate the method of the degree of cytosine methylation described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA

```
DNA that contains the target C is amplified to form a labeled amplicon.

The amplicon is hybridised to two classes, each with at least one member, of ollgonucleotyldes and/or peptide nucleic acid (PNA) oligomers and/or periodises is determined from the classes of phybridisation to both classes is determined from the classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously.

ABD13410-ABD634121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the disclosure of the invention.

ABQ49525 standard; DNA; 592 BP. (first entry) 146 LeuTyr 147 585 TTGTAC 590 12-JUL-2002 ABQ49525; RESULT 11 AB049525 ò 셤

Human; cytosine methylation; 5'-CpG-3'; uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; Oligonucleotide for detecting cytosine methylation SEQ ID NO 36116

methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridisation to beptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the member, of oligomers, the degree of methylation is calculated. The method classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ5421 represent genomic DNA sequences used to illustrate the method of methylation described in the contral contral contral properties. Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the use of atonal-associated nucleic acid or amino acid sequence, or any of its homologues or orthologues as therapeutic agents for the treatment of deathers, partial hearing loss, vestibular effects due to damage or loss of inner hair cells, osteoarthritis and abnormal cell proliferation. The invention also encompasses methods of screening for compounds which affect the expression of an atonal-associated nucleic acid sequence in an animal, and a transgenic animal in which an allele of a native atonal-associated once is replaced by a heterologus nucleic acid sequence, thus any be used in amethod of treating an animal for hearing impairment, only the atonal-associated allele. The nucleic acids or proteins may be used in amethod of treating an animal for hearing impairment, of the disease, balance disorders, abnormal cell proliferation, or other found in they may particularly be used to treat an animal with a protein. They may particularly be used to treat an animal with a protein created to loss of a functional atonal-associated morelect acid or protein. They may particularly be used to treat an animal with a deficiency in cerebellar granule neurons or their precursors, and may

                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the use of atonal-associated nucleic acid or the invention relates to the use of atonal-associated nucleic agents the treatment of deafness, partial hearing loss, vestibular effects due to damage or loss of inner hair cells, osteoarthritis and abnormal cell proliferation. The invention also encompasses methods of screening for compounds which affect the expression of an atonal-associated nucleic acid sequence in an animal, and a transgenic animal in which an allele of a native atonal-associated and transgenic animal in which an allele of sequence, thus in activating the atonal-associated allele. The nucleic acids or proteins may be used in a method of treating an animal for hearing impairment, disease, balance disorders, abnormal cell proliferation, or other disease related to loss of a functional atonal-associated nucleic acid or protein. They may particularly be used to treat an animal with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein. They may particularly be used to treat an animal with a deficiency in cerebellar granule neurons or their precursors, and may also be used in promoting mechanoreceptive cell growth and generating hair cells. The present sequence represents an atomal-associated nucleic acid sequence referred to in the invention.

Note: The present sequence is not shown in the specification, but was obtained from GenBank.
